# Solar Coordinates

- Describe solar position in terms of latitude and longitude
- The position of a point projected onto the plane of the sky can be computed using coordinate transformations
- Solar ephemeris at:

`http://ssd.jpl.nasa.gov/horizons.cgi`

Gives heliocentric latitude (obs sub-lng & sub-lat) and  
PA of spin axis (N. Pole Pos. Ang & Dis)

See example on next slide

# Solar Orientation

Ob-lon Ob-lat =

Apparent planetographic ("geodetic") **longitude and latitude (IAU2006 model) of the center of the target disk seen by the observer at print-time.** Light travel-time from target to observer is taken into account. Latitude is the angle between the equatorial plane and the line perpendicular to the reference ellipsoid of the body (e.g., reflects body oblateness). Positive longitude is to the east. For the gas giants Jupiter, Saturn, Uranus and Neptune, IAU2006 longitude is based on the "System III" prime meridian rotation angle of the magnetic field. By contrast, pole direction (thus latitude) is relative to the body dynamical equator. There can be an offset between the magnetic pole and the dynamical pole of rotation. Units: DEGREES

NP.ang NP.ds =

Target's North **pole position angle** (CCW, or east, with respect to direction of true-of-date Celestial North Pole) and its' angular distance from the sub-observer point (center of disk) at observation time. Negative distance indicates the planet's North pole is on the hidden hemisphere. Units: DEGREES and ARCSECONDS

# Solar Coordinates

$$x = R_{\odot} \sin \theta \cos \phi$$

$$y = R_{\odot} \sin \theta \sin \phi$$

$$z = R_{\odot} \cos \theta$$

$$\dot{x} = -R_{\odot} \sin \theta \sin \phi \dot{\phi}$$

$$\dot{y} = R_{\odot} \sin \theta \cos \phi \dot{\phi}$$

$$\dot{z} = 0$$

$$\dot{\phi} = 2\pi / T$$

$T$  = rotation period

The  $z$ -axis is the solar spin axis

# Coordinate Transformation #1

The solar spin axis is not perpendicular to the ecliptic—the center of the sun as viewed from earth is not  $b=0$

Rotate about the  $y$ -axis by the angle  $\xi$   
Tilt of the solar spin axis towards the earth

## Coordinate Transformation #2

The projected  
solar spin axis is  
not oriented N/S

Rotate about the  $x'$ -axis by angle  $\eta$   
Orientation of the spin axis relative to north

Latitude &amp; Longitude

Velocity contours

Latitude &amp; Longitude

Velocity contours

$$\xi = -7.25^\circ$$
$$\eta = 337^\circ$$
